

- Anticholinergic burden ACB:
- Sedation
- Dry mouth
- Constipation
- Urinary Retention
- Blurred vision
- Postural hypotension
- Cognitive decline
- Mortality

### Anticholinergic Drug Exposure and the Risk of Dementia

JAMA Intern Med. 2019;179(8):1084-1093

- The study evaluated whether exposure to anticholinergic drugs was associated with dementia risk in 58 769 pts. with dementia and 225 574 controls >55 years
- Information on prescriptions for 56 drugs with strong anticholinergic properties was used to calculate measures of cumulative anticholinergic drug exposure

### Anticholinergic Drug Exposure and the Risk of Dementia JAMA Intern Med. 2019;179(8):1084-1093

### There were significant increases in dementia risk for:

- Anticholinergic antidepressants 1.29
- Antiparkinsons drugs 1.52
- Antipsychotics 1.70
- Bladder antimuscarinic drugs 1.65
- Antiepileptic drugs 1.39

Table 3. Numbers of Case Patients and Controls Prescribed Different Types of Anticholinergic Drugs in the 1 to 11 Years Before the Index Date

	Case Patients (n = 58 769)					Controls (n = 225 574)

Ty reducing the otherwise partition on Service. If the periphore don't roturn, depateachtre.

### COUNTERTHINK

WHAT THE DRUG COMPANIES REALLY WANT

# Psychotropics Symptoms control / Comfort

**Antipsychotics Anxiolytics Hypnotics Antidepressants Anti-Epileptics Opioids Cannabinoids Orexin Inhibitors Stimulants** 

The mainstay of the treatment of mood and behavioural disturbances is non-pharmacological Psychotropic drugs should be reviewed after no more than 3 months and the dose reduced and stopped when possible, with the goal of using the lowest effective dose for the shortest period of time.

# Recommendations from Australian and New Zealand Society for Geriatric

### Medicine

- 1.Do not use antipsychotics as the first choice to treat behavioural and psychological symptoms of dementia.
- 2.Do not prescribe benzodiazepines or other sedativehypnotics to older adults as first choice for insomnia, agitation or delirium.
- 4.Do not prescribe medication without conducting a drug regimen review.
- 5.Do not use physical restraints to manage behavioural symptoms of hospitalized older adults with delirium except as a last resort.

## 15G. Chemical restraint to be used only as a last resort

- an approved health practitioner who has day-to-day knowledge of the consumer has:
- (i) assessed the consumer as **posing a risk of harm** to the consumer or any other person, and as requiring the restraint; and
- (ii) documented the assessment, unless the use of the restraint is necessary in an emergency; and
- (b) alternatives to restraint have been used for the consumer to the extent possible; and
- (c) the alternatives to restraint that have been considered or used have been documented, unless the use of the restraint is necessary in an emergency; and
- (d) the restraint is the least restrictive form of restraint possible; and
- (e) the approved provider has the informed consent of the consumer or the consumer's representative to the use of the restraint, unless the use of the restraint is necessary in an emergency.

### Chemical Restraint Legislation

The use of medication or a chemical substance for the purpose of influencing a person's behaviour

other than medication prescribed for the treatment of, or to enable treatment of,

a diagnosed mental disorder,

a physical illness or a physical condition".

### **Rapid Tranquilisation**

- the risks to either the patient or to other people;
- the consequences of potentially escalating violence;
- the risks of potential adverse effects of medicines

### GABAminergic Neuro-inhibition

**Hypothalamus** Spinal **GABA Hippocampus** Cord **GABA** Benzodiazepines Cerebral cortex Flumazenil Extracellular Zolpidem Substantia Nigra cerebellum Sedating High potency Benzos Alprazolam Lorazepam Clonazepam Barbiturates Intracellular Anxiolytic Low Potency Benzos Ion channel Oxazepam **Temazepam** Chlordiazepoxide Source: Bertram G. ### Mood Stabilise

Carbamazepine

Lamotrigine

Topiramate

Valproate

Atypical antipsychotics

## Antiepileptic Drugs for the Treatment of Agitation and Aggression in Dementia: Do They Have a Place in Therapy? D Gallagher, N Herrmann Drugs (2014) 74:1747–1755 NICE 2019

- Antiepileptic drugs (AEDs) have been the focus of considerable attention as potential alternatives
- Carbamazepine continues to have the best evidence to support its use
- There is now more consistent evidence that Valproate preparations should not be used for agitation and aggression in dementia.
- There are limited data for several newer AEDs that warrant further investigation

Assessment of Reported Comparative Effectiveness and Safety of Atypical

Antipsychotics in the Treatment of Behavioral

and Psychological Symptoms of Dementia

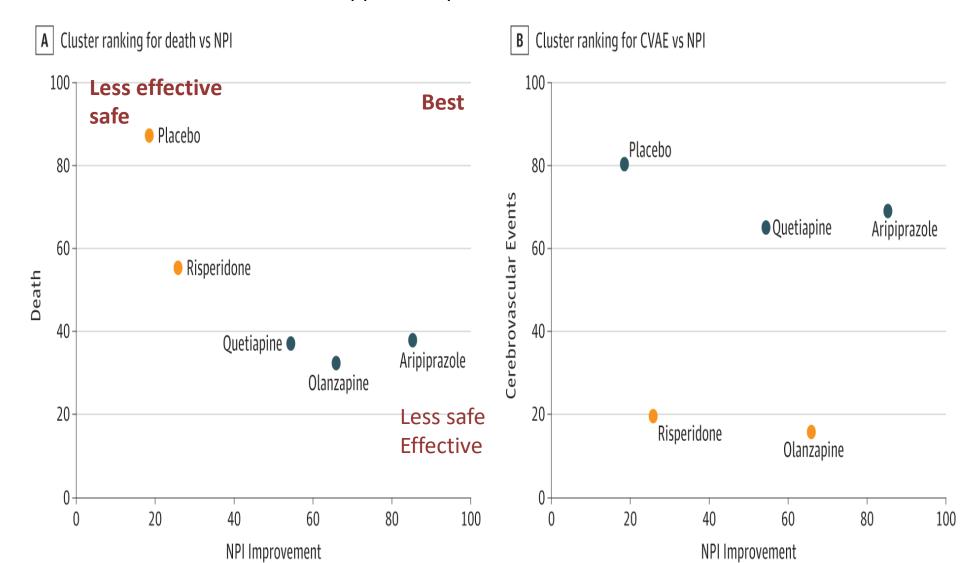

A Network Meta-analysis Yusuna et al. 2019 JAMA

Meta-analysis of 17 randomized clinical trials nursing homes

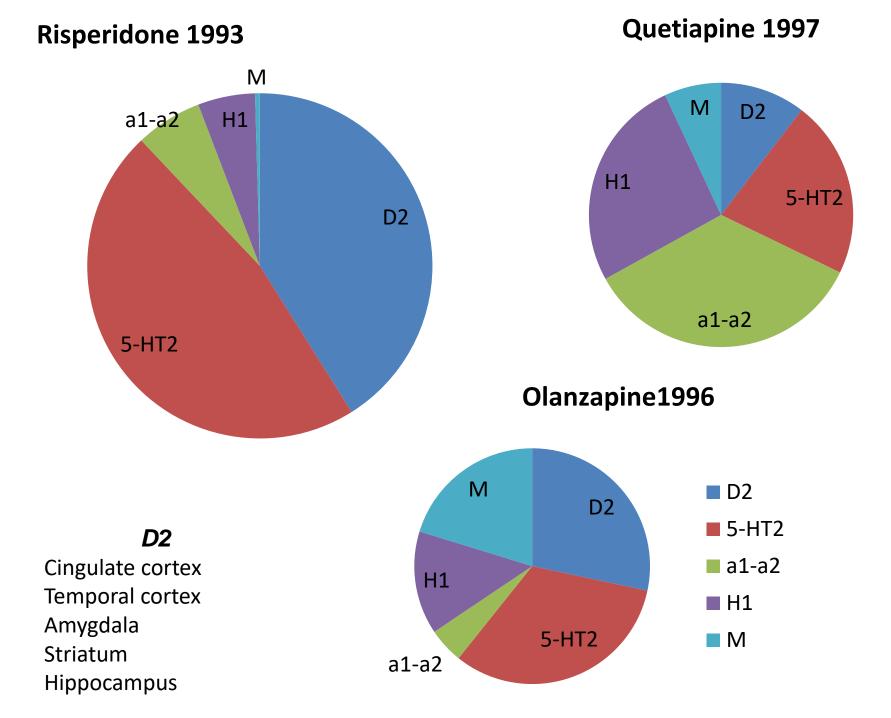

- 5373 pts with AD and Agitation
- Mean age of 80.8 years, nearly 70% women mean duration of follow-up of 10 weeks.
- The medications: Aripiprazole, Olanzapine, Quetiapine and Risperidone

the most widely used atypical antipsychotics

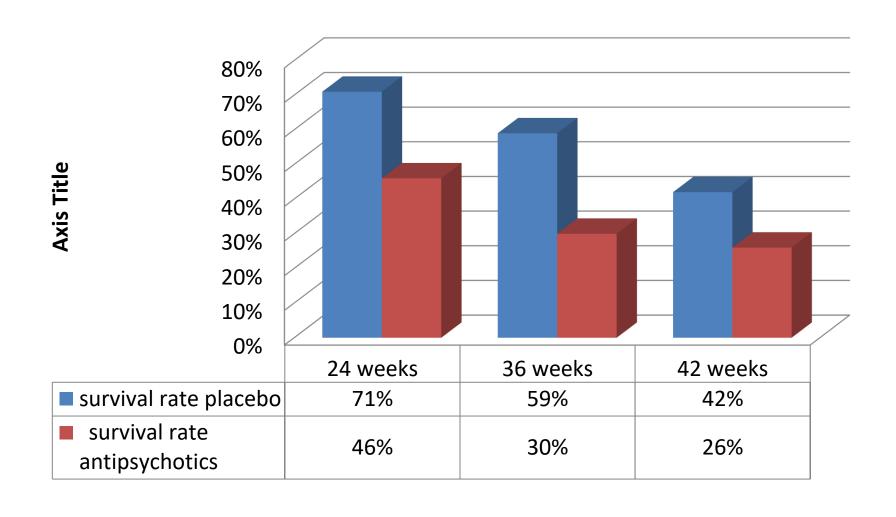

Cluster Ranking Plot for Relative Effectiveness and Safety
The upper right quadrant represents the more effective and more safe treatments;
lower right quadrant, more effective but less safe lower left quadrant, less effective
and less safe; and upper left quadrant, less effective and more safe.

Reference	Intervention	Number of trials	Probability of stroke no antipsychotics	Probability of stroke with antipsychotics
Schneider et al 2006	Aripiprazole Olanzapine Quetiapine Risperidone	15	0.9%	1.9%
Dilip V Jeste et al 2007	Risperidone	3	0.7%	1.6%
Herman Lanctot 2005	Risperidone/ Olanzapine	11	0.8%	2.2%
Schneider et al 2005	Quetiapine	2	0.9%	1.9%

## Best Standards Prescribing anti Psychotics

- Document target symptom: <u>Severe Aggression</u>
- Prescription should be reviewed before D/C
- Plan to review soon after D/C
- Communicate/ consent with family
- Falls prevention/avoidance
- Underlying causes are considered before, Pain

Mental Health Restraint and Seclusion Toolkit Fact Sheet 4

## Comfort Plan for Wellness and Recovery

Aspects of a Comfort Plan

Comfort plans may be known by other names, such as 'personal prevention plans' or 'safety plans'. Regardless of the title, they all contain a minimum of three similar components;

- 1. triggers to the persons anxiety or distress,
- 2. the behaviours a person might exhibit when they are anxious or distressed and
- 3. strategies they find calming or soothing.

patterns of older people with dementia, as measured by wearable technology: A cluster randomised controlled trial

2016 w Moyle W. Jones C. Jenny Murfield Lukman Thalib Elizabeth BeattieDavid Shuma Siobhan O'Dwyera M. Cindy Mervina,h, Brian

Draperi

After 10 weeks, the PARO group showed a greater reduction in daytime step count than usual care (p=0.023), and in night time step count (p=0.028) and daytime physical activity (p=0.026) compared with the plush toy group.

At post-intervention, The PARO group also had a greater reduction in night time physical activity than the usual-care group (p=0.015).

Conclusions: PARO may have some effect on motor activity of older people with dementia in long-term care

#### BRAIN GAMING EFFECTS ON MILD COGNITIVE IMPAIRMENT AND DEMENTIA:

A Collaborative Systematic Review and Meta-Analysis from the American Congress of Rehabilitation Medicine Applied Cognition Geriatric Taskforce (ACGTF):
Pallavi Sood, PhD, Sandra Kletzel, PhD, Ahmed Negm, MD, Shilpa Krishnan, PhD, Xiaolei Hu, MD, Patricia Heyn, PhD, FGSA, FACRM. Hannes Devos, PhD,

#### BACKGROUND

- Mild Cognitive Impairment (MCI) is a transitional state between cognitive changes due to normal aging process and dementia.
- ☐ There are ~ 35.6 million people with dementia in the USA; this number is expected to double every 20 years .
- ☐ Electronic brain gaming, a form of cognitive training, is typically developed or adapted from standard tasks and is engineered in such a way to provide fun cognitively challenging and adaptive tasks that are likely to enhance the user's engagement and motivation. Effectiveness of brain gaming is elusive among older adults with MCI or dementia.

#### **REVIEW AIM**

Systematically evaluate the literature on the effects of brain gaming interventions on cognitive outcomes in older adults with MCI or dementia

#### **METHODS**

This systematic review protocol is registered on PROSPERO (CCRD42015023918)

MESH and Main Key Words: computer/brain/ gaming/ electronic/ MCI/older adult/ dementia/cognitive function

Main Databases: Medline (Ovid), PubMed (NLM), Embase (Embase.com), PsycINFO (Ovid) and Cochrane library (Wiley).

#### **Inclusion Criteria**

- older adults (≥65)
  - Evidence of mild cognitive impairment or dementia of Alzheimer's (AD) type
- Brain gaming Tx
- Assess cognitive outcomes randomized controlled trials (RCT) or non-randomized multi-group design with an experimental (brain gaming) and comparator group.

Common reasons for **exclusion**: Review articles, healthy aging, not AD related cognitive impairment, cognitive training other than brain gaming.

PRISMA Chart: A priori protocol was developed in accordance with the Preferred Reporting Items for Systematic Reviews and Meta-Analyses (PRISMA).

Identification

Records identified through main database searches (n=766), other data bases (n=95) hand search (n=17) and with duplicates (n=200) removed TOTAL n=678

Screening

#### CONCLUSION

- Current evidence shows brain gaming is not any more effective than control interventions in improving cognitive functions among adults with mild cognitive impairment (MCI) or dementia.
- However, there is a clear need for rigorous RCTs that are designed to detect clinically relevant changes in cognitive function outcomes
- Additional evaluation on different brain games technologies, prescriptions and participant adherence is needed in future research.

## **Tovertafel Original**

Interactive games for people with a cognitive impairment that connects people and stimulates movement

# Relax in the here and now with dancing lights, beautiful colours and soothing sounds

2 2 3 Cognitive Social Physical

The game uses high-contrast projections

Projections are always spread across the table

Projected images naturally inspire movement or touch

The game gives sufficient reaction times

The game reacts to minimal and/or slow movements
Projections slow down as soon as they are within reach

The game only gives positive feedback
